

ABSTRACT

A file is delivered from a client to a server for printing. A path and a name of the file are received. A file type of the file is discovered. The file type of the file is discovered either by analyzing the contents of the file or comparing the extension of the file to a list of print ready extensions. Contents of the file are analyzed to discover elements irresolvable by a printer. The elements of the file irresolvable by the printer are resolved. A write of the file to the server is initiated if the file is print ready. A user interface for providing a user with printing options is opened.
